

DotNetNuke

Easy to Use

Extensible

Highly Scalable

DotNetNuke is the leading Web Content Management Platform for Microsoft .NET. Our open platform allows you to quickly, inexpensively change the appearance or functionality of your web site by installing software apps. Nearly 10,000 commercial apps are available at Snowcovered.com, free apps are available in the standard DotNetNuke install package or the DotNetNuke Extensions Forge, and the open API enables you to create your own custom apps.

The DotNetNuke Enterprise Edition is for organizations with multiple content contributors that deploy DotNetNuke in critical web applications. Content staging is highly valuable if you require high accuracy and control over the functionality and content on your web site. The Enterprise Edition content staging feature allows your organization to make web site changes on a staging server, review and test the changes, then push them to your production server.

Content Staging Features

Content staging allows you to **utilize a separate staging server** where all intended web site changes are implemented and tested. Your staging server will typically be physically separate from your production server and behind your corporate firewall.

The content staging system **compares your staging server configuration to your production server** to identify missing components. The system provides a detailed view of all planned changes in both a tabular and a tree structure.

A built-in **audit feature creates a record** of all publishing events to the production server for easy review.

Content staging using the Enterprise Edition is a tightly controlled, reliable method which enables your organization to ensure that **changes to your web site are fully tested and vetted** before they are pushed to production.
